

Fibre-Concrete Round Pipe

Formwork spreaders for reinforced concrete walls.

The fibre-reinforced concrete round tubes are accessories used as formwork spreaders for reinforced concrete walls. Fibre concrete is created by adding carbon, textile, steel or glass fibres to conventional concrete. The resulting fibre concrete is stable, resilient, durable and much lighter than normal concrete. The round pipes have been tested and verified as watertight in waterproofing components. Their inner diameter is 22 mm, outer diameter is 40 mm and they have a standard length of 1280 mm. Other dimensions, e.g. sections from 100 to 600 mm in length, are also possible on request.
