

ISOPRO® HBQ

ISOPRO® HBQ is a thermally insulated connection with an 80 mm insulating body for connecting supported timber structures with reinforced concrete components. It is suitable for transmitting positive shear forces and horizontal forces. The element consists of an EPS insulating body with extremely low thermal conductivity and a structurally effective framework made of stainless steel. The elements are installed in the shell over the course of the reinforcement and casting work. The wooden construction will be assembled by a carpenter at a later date. Please specify the load-bearing capacity and element height when ordering.
