

## PLURAFLEX® Storage Box

For protecting the filling and venting hoses in the concrete component

When using PLURAFLEX® protective boxes, the PLURAFLEX® injection hose system is injected through filling and venting hoses inserted about 10 cm into the protective boxes. In horizontal construction joints, the protective boxes must be located around 15 cm above the joint; in vertical construction joints, they must be positioned next to the joint. The protective boxes must be positioned at spots that will be easily accessible later on.
